

Recommended surface treatment:

Water-based wood impregnating agent

- Granite and wood elements are sensitive to intense contact with hard, sharp objects, which can damage the materials, so they require special care when using them.
- The recommended cleaning products listed below are only suggestions and may vary, but it is advisable to check the intended use, composition and efficacy before buying.
- In case the configuration includes a refrigerator, the refrigerator must be plugged-in and operate at ambient temperatures above 10 °C.

Maintenance Guide

- Outdoor Kitchens -

www.grillandia.com

All components of Grillandia outdoor kitchens are made of durable, weather-resistant materials that do not really require increased protection or constant maintenance, but by following these suggestions you can keep your outdoor kitchen in its original condition for a long time.

1. Metal surfaces:

- It is recommended to clean aluminium surfaces, stainless steel or aluminium doors, drawers and inserts with a special stainless steel cleaner, using a soft cloth, avoiding the use of substances that cause scratching or abrasion.
- **The use of acetone-based products and cold degreasing agents is prohibited!**
- It is also recommended to protect stainless steel door fronts and built-in devices from highly chlorinated water (e.g. pool water), as this can cause discolouration of the surface in the long term.

Recommended cleaning agent:

e.g. Meda Blomus / HG stainless steel cleaning agent

2. Granite:

- You can treat granite countertops with lukewarm water and an acid-free cleaner.
- It is worth noting that granite is naturally prone to absorbing liquids. In the case of water, this will evaporate from the stone in a few days at most, but grease and oil can be absorbed and leave traces over a longer period of time. To prevent this and for aftercare, the use of special granite cleaning products is recommended (at least twice a year).

Recommended cleaning agent:

Bellinzoni Idea HP water and oil repellent impregnator Oil-Ex Lithofin oil stain remover

3. Wood Surfaces:

- The wooden components are made of poplar wood that has undergone a multi-stage heat treatment (Thermowood) and are therefore resistant to temperature and humidity fluctuations.
- Treatment of wood elements is recommended 2 times a year, before and after the season. Wood is a natural material, so even with treatment, it can still discolour and crack due to environmental influences.
